ENVIRONMENTAL IMPACT REPORT SUMMARY

The following is a summary of portions of an Environmental Impact Report applicable to interests of the State Lands Commission. The EIR, entitled Colorado River Basin Salinity Control Project, was completed in June, 1975 by the Department of the Interior, Water and Power Services.

As a component of the project, additions to the USBR Parker-Davis Project transmission system will be required to serve the desalting complex load adequately. The alignment will parallel an existing line crossing the Colorado River in Section 25, T.16S, R21E, SBM, Imperial County. At this crossing the line should cause no significant impact, although the proposed steel transmission line towers at the River may adversely affect area aesthetics. Tower heights will be 60 - 70 feet with intervals of 700 - 800 feet. The Colorado River crossing is an established transmission line river crossing.

Pertinent mitigation measures in response to possible impacts include:

- A) Controlling operations so as to disturb the minimum amount of rights-of-way. Only necessary amounts of vegetation will be cleared within the rights-of-way.
- B) Provision for watering devices to reduce dust nuisance on access roads and in work areas.
- C) Transmission lines and related facilities will be designed and constructed in accordance with the Department of the Interior's "Environmental Criteria for Electric Transmission Systems".

The project has received appropriate archeological clearance.
